

Service Discovery using Docker and Kubernetes

Arun Gupta, @arungupta

Docker Workflow

Why Service Discovery?

Development using Docker

- Docker Community Edition
 - Docker for Mac/Windows/Linux
 - Monthly edge and quarterly stable releases
 - Native desktop or cloud provider experience

Docker for Mac/Windows

- Native application and UI
- Auto update capability
- No additional software required, e.g. VirtualBox
 - OSX: xhyve VM using `Hypervisor.framework`
 - Windows: Hyper-V VM
- Download: docker.com/getdocker
- Requires Yosemite 10.10+ or Windows 10 64-bit

Swarm-mode: Initialize

```
docker swarm init --listen-addr <ip>:2377 --secret <SECRET>
```

Swarm-mode: Add Worker

```
docker swarm join --secret <SECRET> <manager>:2377
```

Swarm-mode: Add More Workers

```
docker swarm join --secret <SECRET> <manager>:2377
```

Swarm-mode: Primary/Secondary Master

```
docker swarm join --manager --secret <SECRET> --listen-addr  
<master2>:2377 <master1>:2377
```

Swarm-mode: Replicated Service

```
docker service create --replicas 3 --name web jboss/wildfly
```

Swarm-mode: Routing Mesh

- Load balancers are host-aware, not container-aware
- Swarm mode introduces container-aware routing mesh
- Reroutes traffic from any host to a container
 - Reserves a Swarm-wide ingress port
 - Uses DNS-based service discovery

Swarm-mode: Routing Mesh

```
docker service create --replicas 3 --name web -p 8080:8080 jboss/wildfly
```

Service Discovery with Docker

```
1  version: "3"
2  services:
3    db:
4      image: arungupta/couchbase:travel
5      ports:
6        - 8091:8091
7        - 8092:8092
8        - 8093:8093
9        - 11210:11210
10   web:
11     image: arungupta/wildfly-couchbase-javaee:travel
12     environment:
13       - COUCHBASE_URI=db
14     ports:
15       - 8080:8080
16       - 9990:9990
```

`docker stack deploy --compose-file=docker-compose.yml webapp`

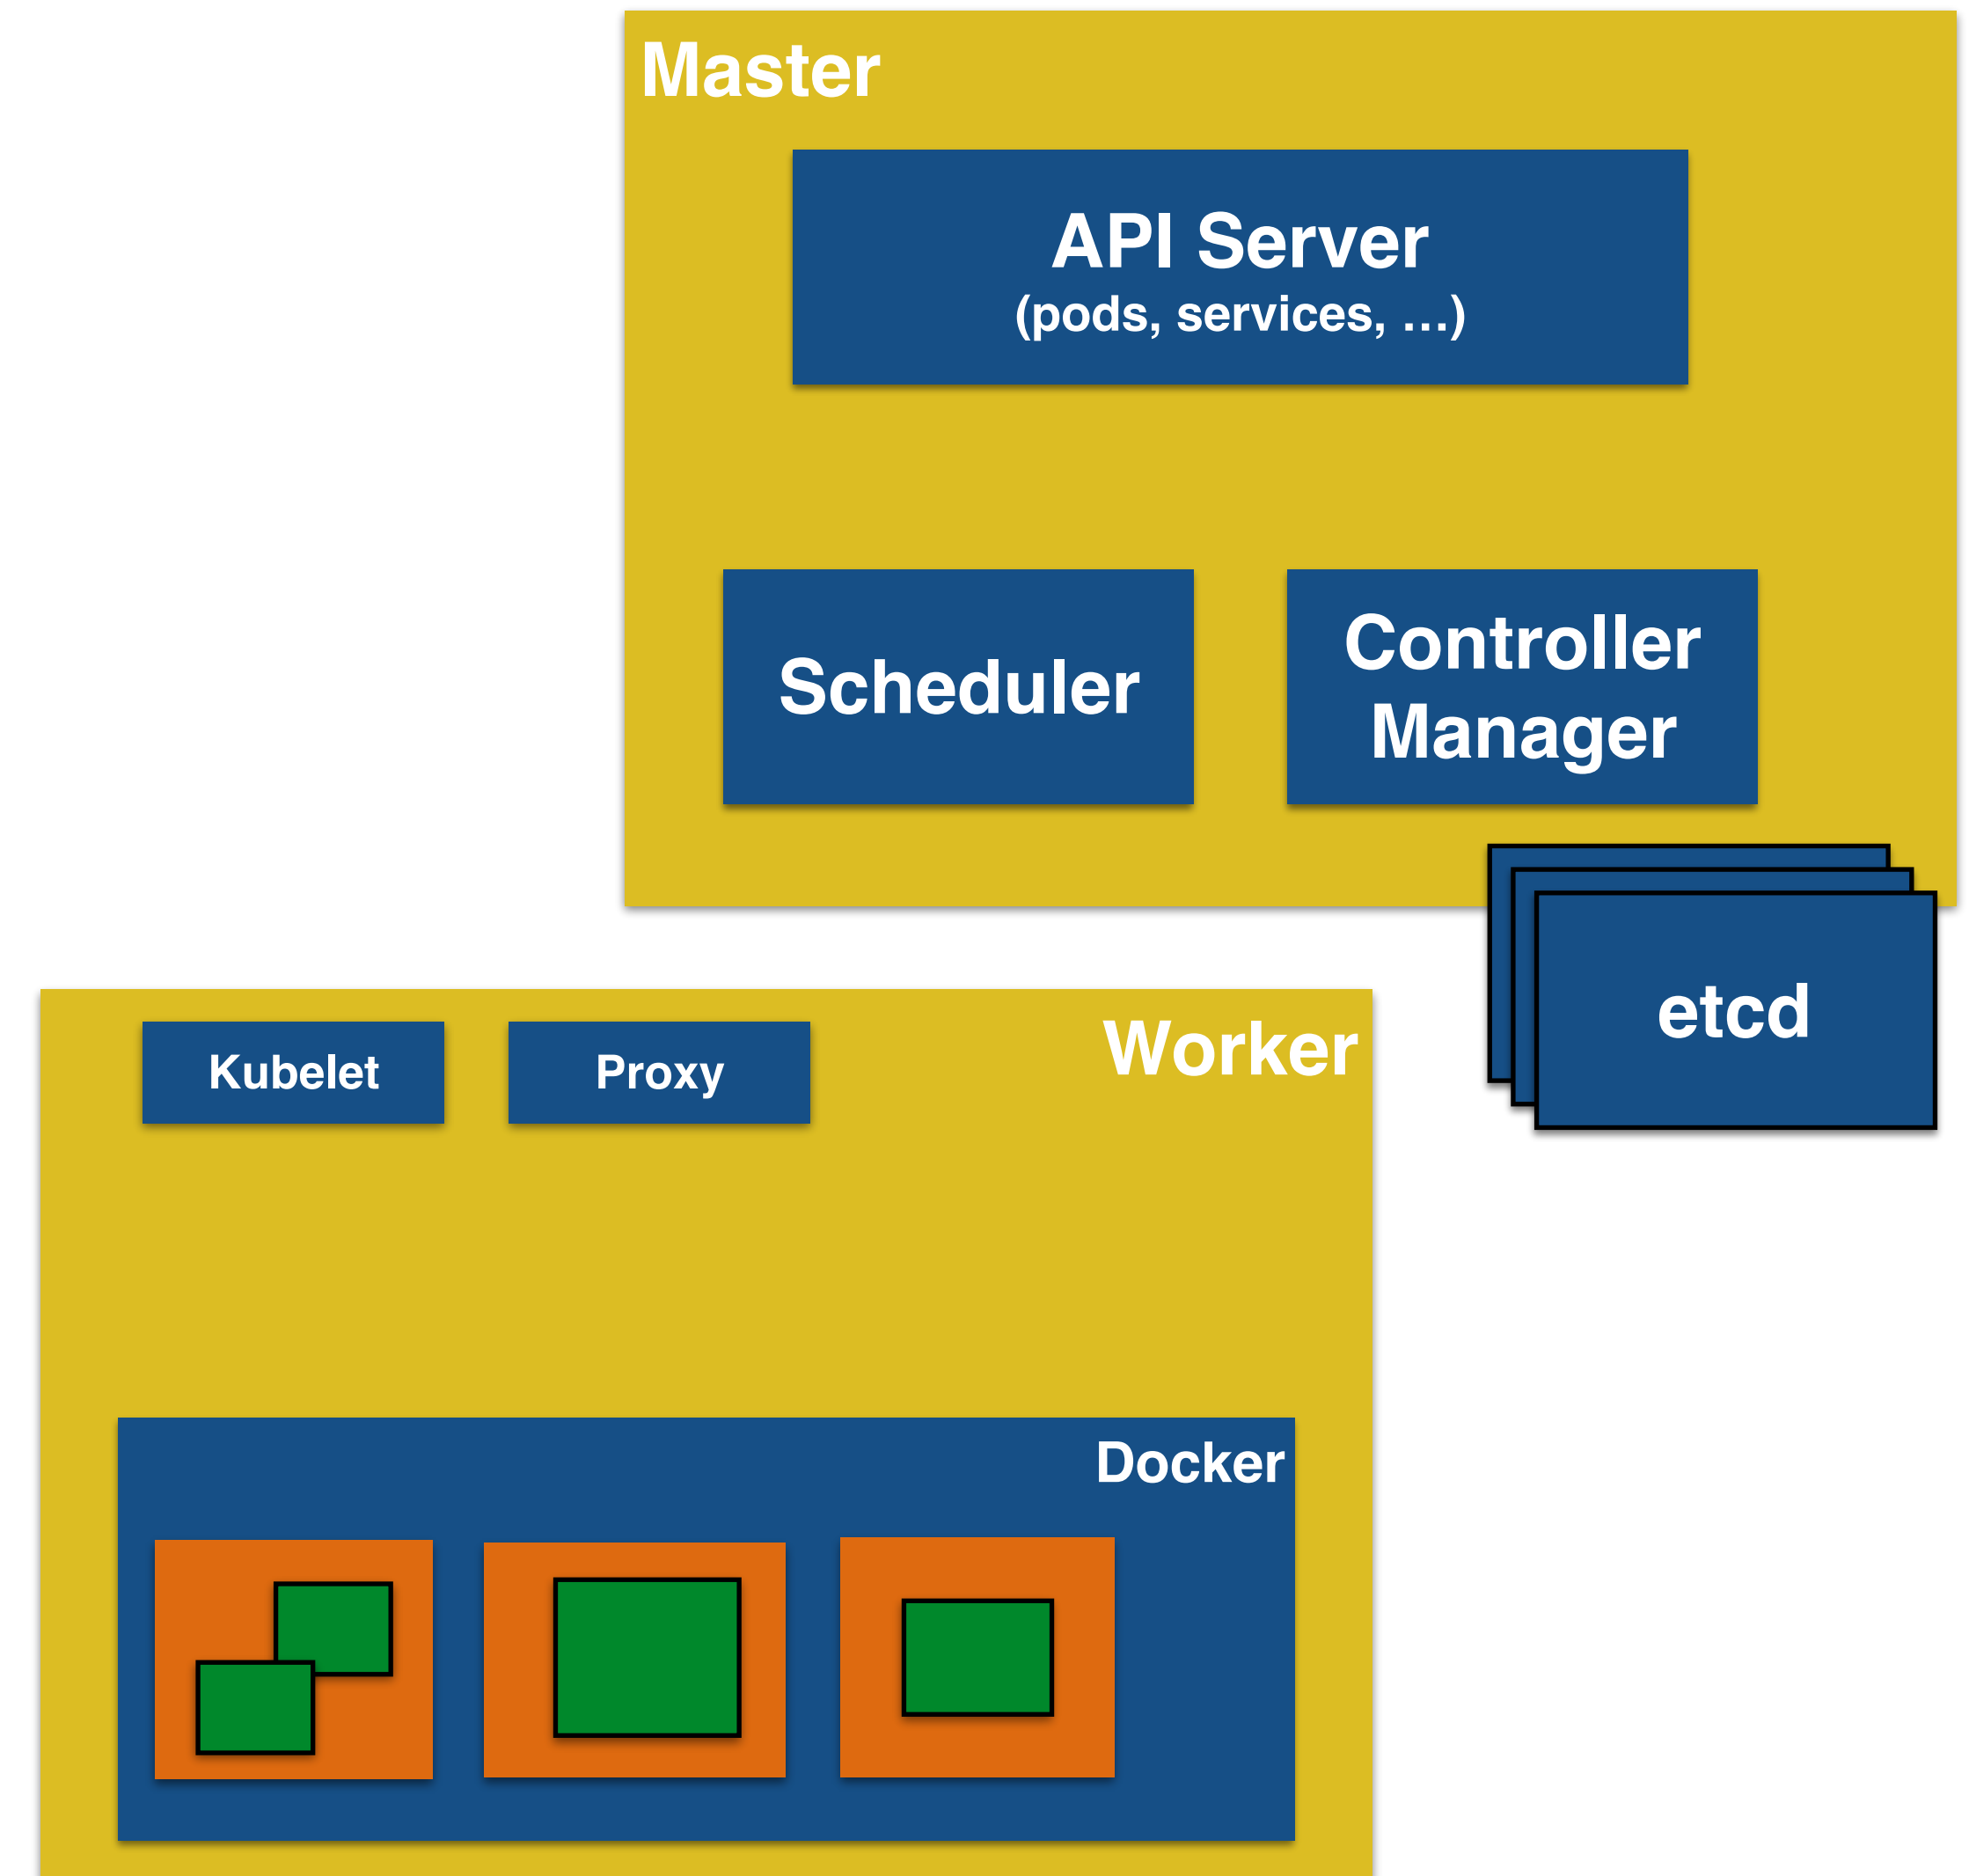

Kubernetes Concepts

- **Pods**: collocated group of Docker containers that share an IP and storage volume
- **Service**: Single, stable name for a set of pods, also acts as LB
- **Label**: used to organize and select group of objects
- **Replica Set**: manages the lifecycle of pods and ensures specified number are running

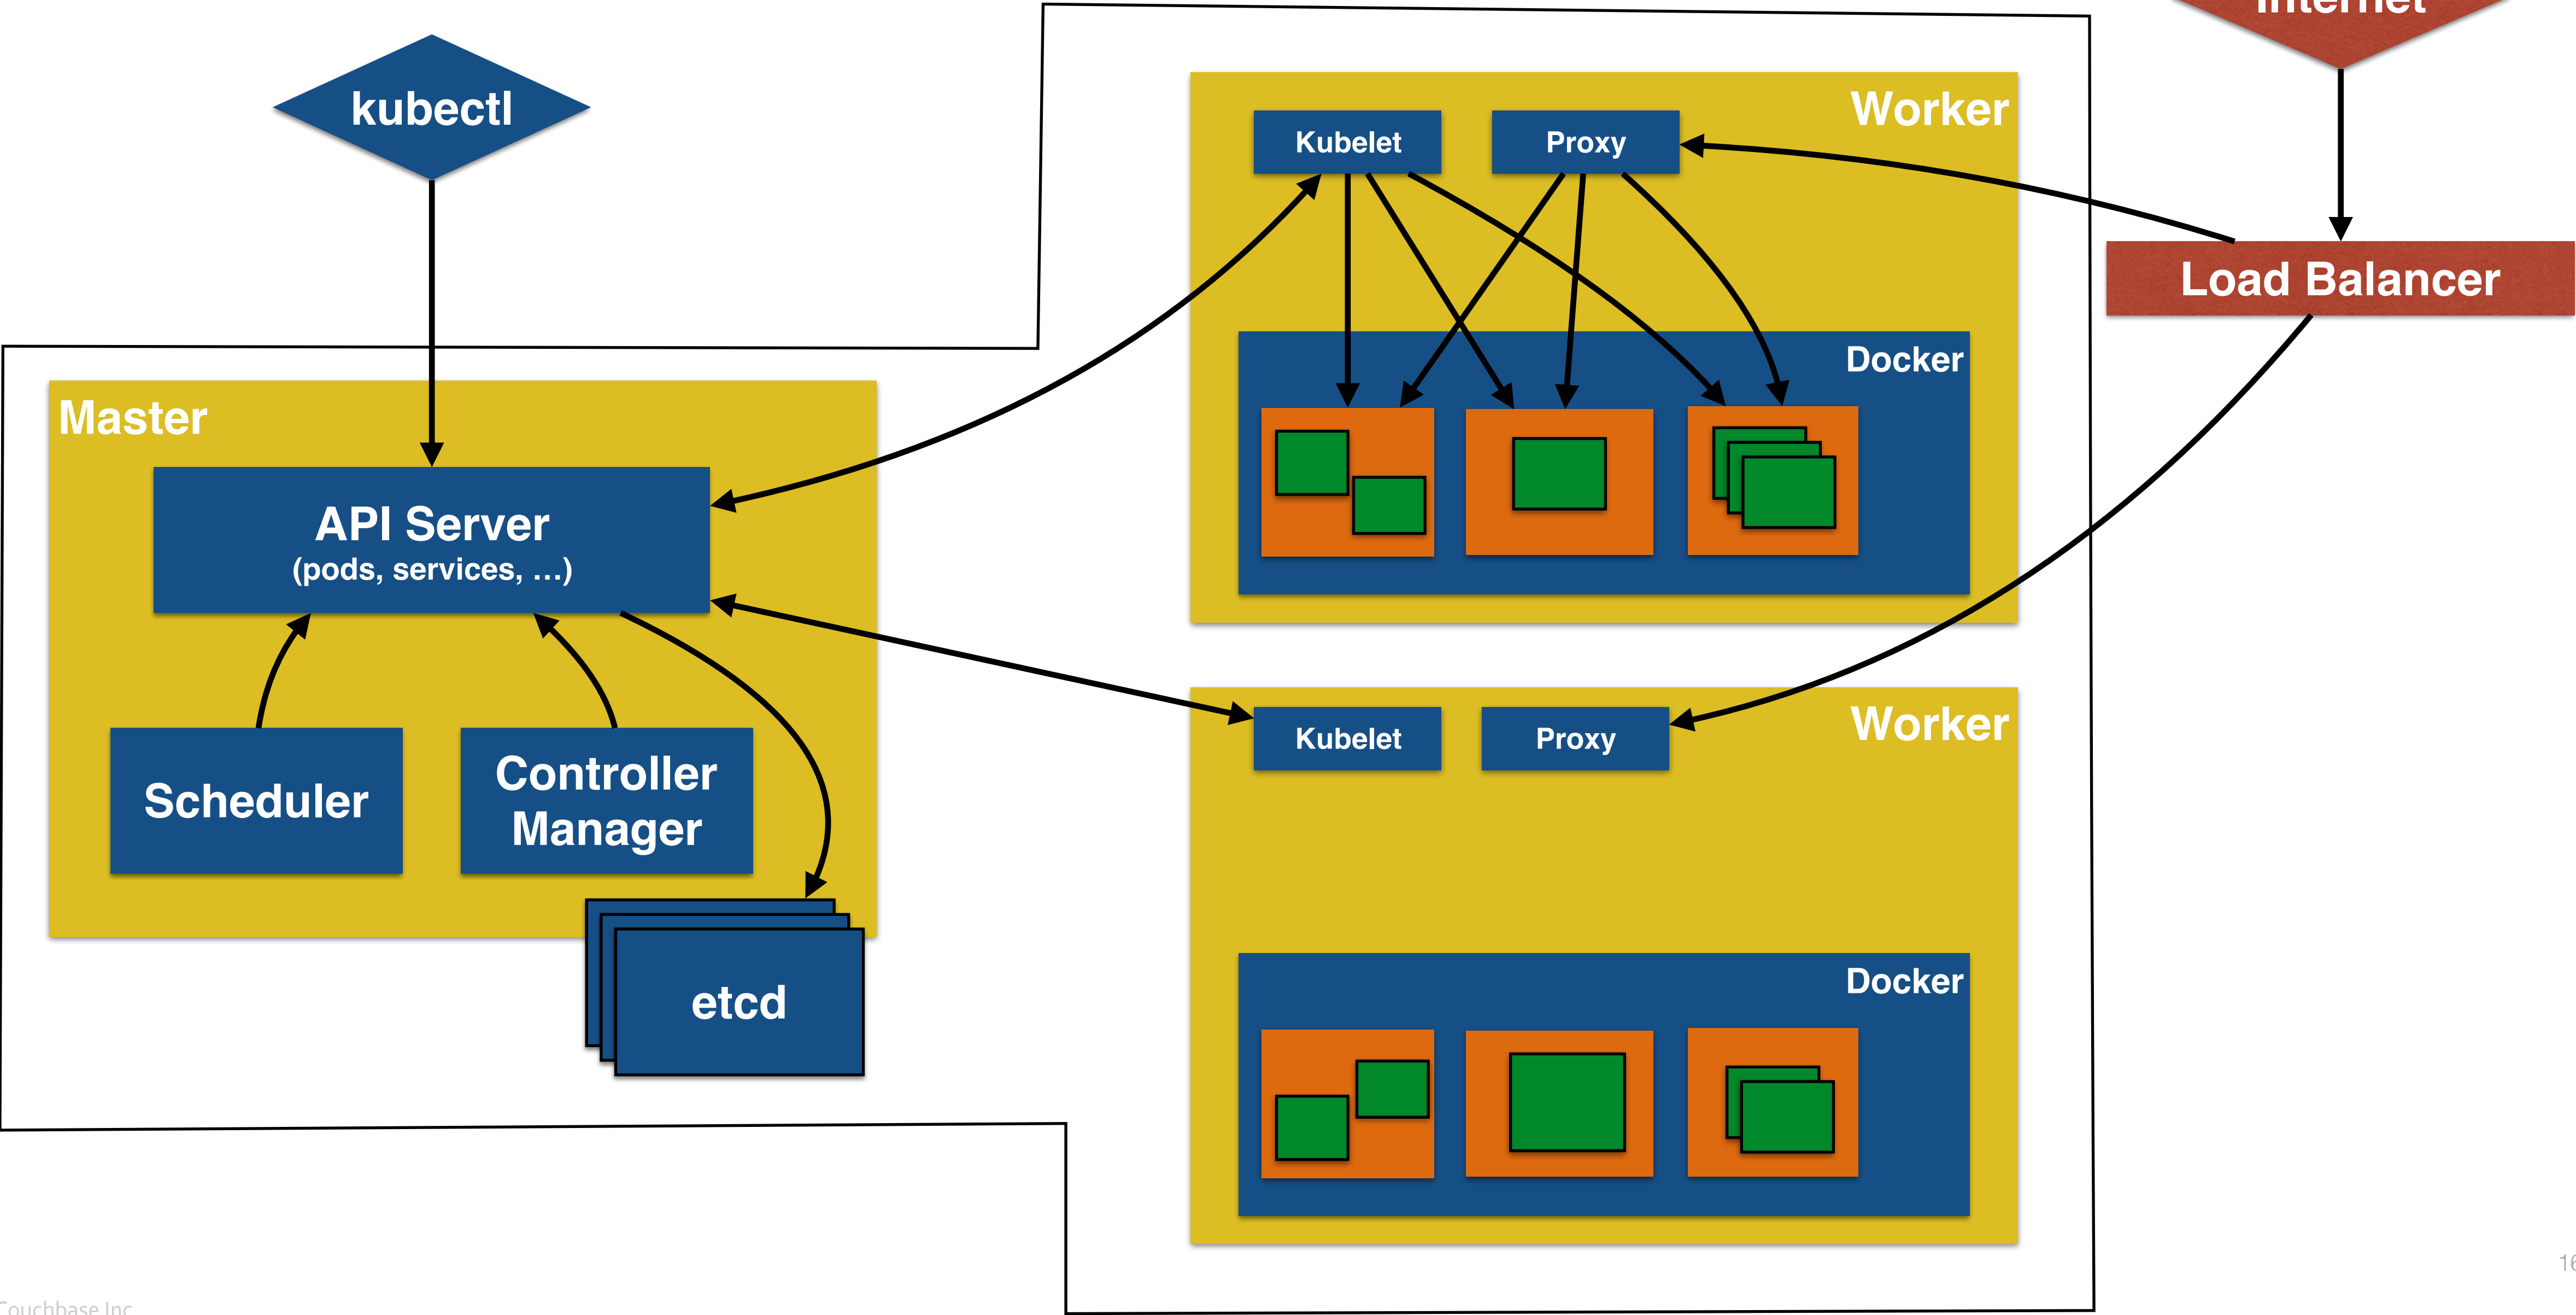

Core Concepts: Kubernetes

- **Node:** Machine or VM in the cluster
- **Master:** Central control plane, provides unified view of the cluster
 - **etcd:** distributed key-value store used to persist Kubernetes system state
- **Worker:** Docker host running *kubelet* (node agent) and *proxy* services
 - Runs pods and containers
 - Monitored by *systemd* (CentOS) or *monit* (Debian)

Kubernetes Cluster

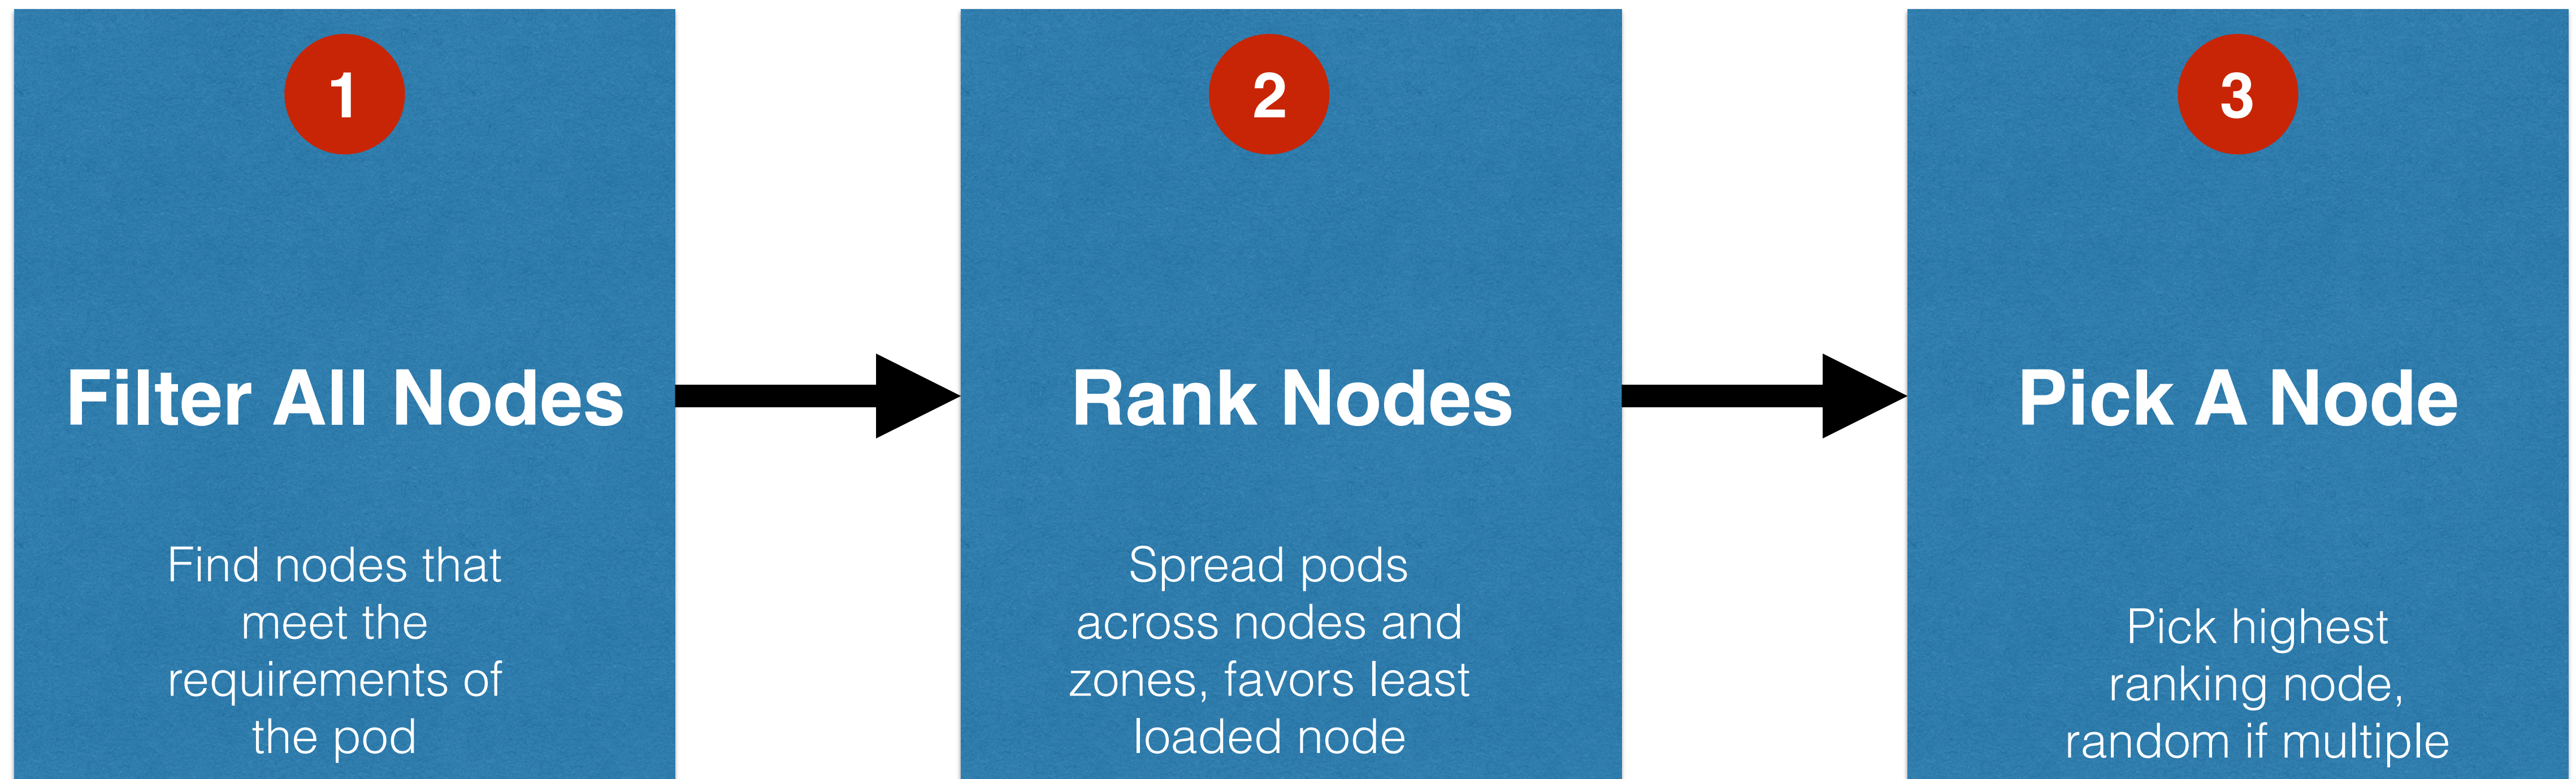

Development using Kubernetes

- Single node cluster
 - minikube
- Multi-node cluster
 - kops
 - kube-aws (CoreOS + AWS)
 - kube-up (deprecated)
 - Google Cloud, Azure, Tectonic, ...

kubectl

- Controls the Kubernetes cluster manager
- `kubectl get pods or minions`
- `kubectl create -f <filename>`
- `kubectl update or delete`
- `kubectl resize --replicas=3 replicaset <name>`

Kubernetes Scheduling Algorithm

Kubernetes Configuration File

```
1  apiVersion: v1
2  kind: Service
3  metadata:
4  name: couchbase-service
5  spec:
6  selector:
7  app: couchbase-rs-pod
8  ports:
9    - name: admin
10     port: 8091
11    - name: views
12     port: 8092
13    - name: query
14     port: 8093
15    - name: memcached
16     port: 11210
17  ---
18  apiVersion: extensions/v1beta1
19  kind: ReplicaSet
20  metadata:
21  name: couchbase-rs
22  spec:
23  replicas: 1
24  template:
25    metadata:
26    labels:
27    app: couchbase-rs-pod
28  spec:
29    containers:
30    - name: couchbase
31      image: arungupta/couchbase:travel
32      ports:
33        - containerPort: 8091
34        - containerPort: 8092
35        - containerPort: 8093
36        - containerPort: 11210
37  ---
38  apiVersion: extensions/v1beta1
39  kind: ReplicaSet
40  metadata:
41  name: wildfly-rs
42  labels:
43  name: wildfly
44  spec:
45  replicas: 1
46  template:
47    metadata:
48    labels:
49    name: wildfly
50  spec:
51    containers:
52    - name: wildfly-rs-pod
53      image: arungupta/wildfly-couchbase-javaee:travel
54      env:
55      name: COUCHBASE_URI
56      value: couchbase-service
57    ports:
58    - containerPort: 8080
59  ---
```

```
graph LR
    subgraph Service [Service]
        S_name["name: couchbase-service"]
    end
    subgraph Couchbase_RS [Couchbase ReplicaSet]
        C_app["app: couchbase-rs-pod"]
    end
    subgraph Wildfly_RS [Wildfly ReplicaSet]
        W_env["name: COUCHBASE_URI<br/>value: couchbase-service"]
    end
    S_name --> C_app
    S_name --> W_env
    C_app --> W_env
```
